Title: Novel candidate metastasis genes as putative drug targets for breast cancer

Date: 2012-12-12

A grayscale microscopic image showing numerous breast cancer cells. The cells are irregular in shape, with some appearing as elongated, branching structures and others as more rounded, isolated cells. They are distributed across the entire frame, with some areas showing higher density than others. The background is a light gray, and the cells are darker, with some showing internal structure and nuclei.

Novel candidate metastasis genes as putative drug targets for breast cancer
